

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1-23. (Cancelled)

24. (Previously Presented) A cellular communication terminal comprising:

a receiver and a transmitter configured to receive and transmit data packets according to the Wireless Application Protocol from at least one server through a gateway or proxy server which transmits the data packets between the terminal and at least one server;

a first memory comprising an identifier and at least one item, the at least one item having an access point which indicates a location of the at least one server to be accessed, wherein the at least one server is accessible by sending the identifier to the gateway or proxy server to identify a first content to be accessed at the at least one server, and wherein the first content is associated with link content provided at different locations in the at least one server or in another server;

a processor configured to provide a Wireless Application Protocol Environment including a Wireless Application Protocol browser which is configured to read an item from the first memory and to establish a session to the gateway or proxy server, and to fetch a copy of the first content from the at least one server at the location indicated by the access point, to be stored in the first memory or in a second memory, wherein the second memory is arranged to store temporarily or permanently the copy of the first content;

a user interface connected to the processor, the user interface including a display configured to display the copy of the first content received from the at least one server and a user input configured to control the processor;

wherein the receiver and transmitter are configured to fetch a copy of the first content and a copy of the link content simultaneously upon a request generated by the processor in accordance with the Wireless Application Protocol, the transmitter configured to send the request as a data packet, comprising an instruction to the at least one server to send the copy of the first content from a given location in the at least one server, indicated by the access point, together with a copy of the link content, simultaneously; and

wherein the terminal is cellular phone.

25. (Previously Presented) The terminal according to claim 24, wherein the first content and the link content is provided in the same server.

26. (Previously Presented) The terminal according to claim 24, wherein the Wireless Application Protocol browser comprises a pull means which includes a selecting means in order to choose which content is to be fetched.

27. (Previously Presented) The terminal according to claim 24, wherein the second memory is an external memory, provided with a connection to the terminal.

28. (Previously Presented) The terminal according to claim 24, wherein the second memory is in the terminal.

29. (Previously Presented) The terminal according to claim 24, wherein the second memory is a cache memory.

30. (Previously Presented) The terminal according to claim 24, wherein the first memory is a SIM card.

31. (Cancelled)

32. (Previously Presented) A method comprising:
reading an item in first memory and an identifier, the item comprising at least one access point indicating the location of a server to be accessed;
generating a request in accordance with the Wireless Application Protocol, the request comprising information of the at least one access point, and the identifier identifying a first content of the at least one access point, the first content being associated with link content provided at different locations in the server or in another server;
initiating a session to a gateway or proxy server according to the Wireless Application Protocol, by transmitting the request from the cellular communication terminal to the gateway or proxy server, the gateway or proxy server sending data packets between the terminal and the server; and

establishing a session between the terminal and the gateway or proxy server according to the Wireless Application Protocol, wherein the request has an instruction to the server to send a copy of the first content from a given location in the server, indicated by the access point, together with a copy of the link content, simultaneously, and
fetching a copy of the first content and a copy of the link content simultaneously.

33. (Previously Presented) A method according to claim 32, wherein the copy of the first content and the link content is stored in a second memory.

34. (Previously Presented) A method according to claim 32, wherein the copy of the first content and the link content are from the same server.

35. (Previously Presented) A method according to claim 34, comprising fetching a copy of the link content from a further server.

36 - 46. (Cancelled)

47. (Currently Amended) A method comprising:
receiving data packets according to the Wireless Application Protocol from a cellular communication terminal;

within the data packets, receiving a request in accordance with the Wireless Application Protocol, the request comprising information of at least one access point indicating a location of the server to be accessed and an instruction to the server to send a copy of a first content from a location in the server together with a copy of link content simultaneously, wherein the first content of at least one access point is identified by an identifier and the first content is associated with the link content provided at different locations in at least one of the server and another server; and

~~effectuating a process of simultaneously fetching~~ sending the copy of the first content and the link content ~~from the server~~ simultaneously to the cellular communication terminal.

48. (Previously Presented) A method according to claim 47, wherein the copy of the first content and the link content are from the same server.

49. (Previously Presented) A method according to claim 47, wherein the copy of the first content and the link content is stored in a memory of a cellular communication terminal.

50. (Currently Amended) A computer program product, embodied on a non-transitory computer-readable medium comprising computer code configured to perform the processes of claim 47.

51. (Currently Amended) A server, comprising:
a processor unit; and
a memory unit operatively connected to the processor unit and including:
computer code configured to receive data packets from a cellular communication terminal;
computer code configured to receive a request in accordance with the Wireless Application Protocol within the data packets, the request comprising information of at least one access point indicating a location of the server to be accessed and an instruction to the server to send a copy of a first content from a location in the server together with a copy of link content simultaneously, wherein the first content of at least one access point is identified by an identifier and the first content is associated with the link content provided at different locations in at least one of the server and another server; and
computer code configured to ~~effectuate a process of simultaneously fetching~~ send the copy of the first content and the link content from the server simultaneously to the cellular communication terminal.

52. (Previously Presented) A server according to claim 51, wherein the copy of the first content and the link content are from the same server.

53. (Previously Presented) A method of fetching content from a server, comprising:
transceiving data packets from at least one server during an established session according to the Wireless Application Protocol;

effectuating access to the server by receiving an access point indicating a location of the server to be accessed and an identifier identifying a first content to be accessed, wherein the first content is associated with link content provided at different locations in one of the server and another server; and

participating in a fetching process comprising fetching a copy of the first content from the server at the location indicated by the access point and fetching a copy of the link content simultaneously in response to a request in accordance with the Wireless Application Protocol sent as a data packet included within the transceived data packets, the request including an instruction to the server to send the copy of the first content from a given location in the server indicated by the access point together with the copy of the link content, simultaneously.

54. (Previously Presented) A method according to claim 53, wherein the first content and the link content is provided in the same server.

55. (Currently Amended) A computer program product, embodied on a non-transitory computer-readable medium comprising computer code configured to perform the processes of claim 53.

56. (Previously Presented) A server, comprising:
a processor unit; and
a memory unit operatively connected to the processor unit and including:
computer code configured to transceive data packets from at least one server during an established session according to the Wireless Application Protocol;
computer code configured to effectuate access to the server by receiving an access point indicating a location of the server to be accessed and an identifier identifying a first content to be accessed, wherein the first content is associated with link content provided at different locations in one of the server and another server; and
computer code configured to participate in a fetching process comprising fetching a copy of the first content from the server at the location indicated by the access point and fetching a copy of the link content simultaneously in response to a request in accordance with the Wireless Application Protocol sent as a data packet included within the

transceived data packets, the request including an instruction to the server to send the copy of the first content from a given location in the server indicated by the access point together with the copy of the link content, simultaneously.

57. (Previously Presented) A server according to claim 56, wherein the first content and the link content is provided in the same server.

58. (Currently Amended) A computer program product, embodied on a non-transitory computer-readable medium for fetching content from at least one server comprising:

computer code configured to receive and transmit data packets according to the Wireless Application Protocol from at least one server through a link which transmits the data packets between the terminal and the at least one server;

computer code configured to store in a first memory, an identifier and at least one item, the at least one item is provided with an access point which indicates a location of the at least one server to be accessed, wherein the at least one server is accessed by sending the identifier to the link to identify a first content to be accessed at the at least one server, and wherein the first content is associated with link content provided at different locations in the at least one server or in another server;

computer code configured to establish a session according to the Wireless Application Protocol to the link by reading an item from the first memory, and fetching a copy of the first content from the at least one server, at the location indicated by the access point, to be stored in the first memory or in a second memory, wherein the second memory temporarily or permanently stores the copy of the first content;

computer code configured to display the copy of the first content received from the at least one server and a user input which controls the browser application; and

computer code configured to fetch a copy of the first content and a copy of the link content simultaneously upon a request generated by the browser application in accordance with the Wireless Application Protocol, the request being sent through a transmitter as a data packet, comprising an instruction to the at least one server to send a the copy of the first content from a given location in the at least one server, indicated by the access point, together with a copy of the link content, simultaneously.

59. (Previously Presented) A computer program product according to claim 58, wherein the first content and the link content is provided in the same server.

60. (Cancelled)
